

Comprehensive Care Standard Action 5.19

The [Comprehensive Care at the End of Life](#) actions form part of the National Safety and Quality Health Care Standards (2021).

5.19: The health service organisation has processes for routinely reviewing the safety and quality of end-of-life care that is provided against the planned goals of care.

What data are collected about the safety and quality of end-of-life care, and how are these data reviewed to ensure they align with planned goals of care for the patient?

Goals of Care refer to what matters to the patient; they are agreed between the patient, family, carers, and health care team. Goals of Care will change over time and should be reassessed as necessary. They may include all types of care or considerations ranging from medical interventions, place of care, types of nutrition or hydration, and patient values. Consider accessing the End-of-Life Essentials [Goals of Care at the End of Life Module](#) and [Toolkit](#) as evidence of training across your organisation.

Access the End-of-Life Essentials [Chronic Complex Illness End-of-Life Care Module](#), and [Toolkit](#). The module aims to equip learners with the knowledge and skills to be able to:

- recognise the impact of increased hospitalisation on people living with chronic complex conditions.
- recognise that concepts of 'living' are equally relevant to 'dying' in end-of-life conversations.
- demonstrate the importance of 'uncertainty' in disease trajectories as a trigger in starting end-of-life conversations and advance care planning.

The [Recognising Dying Training Resources](#) are available to support the education of staff around factors that may influence when end of life begins for a patient. Consider the following seminar questions: "Think about one patient that died recently on your ward or unit. Was their death expected by the team? Was the death discussed or audited? What is the one thing that you learnt about that death that will change your practice tomorrow?"

Access the End-of-Life Essentials **Meeting the Standards Module** and **Toolkit** to learn more about how your organisation could demonstrate that care provided aligns with an individual patient's wishes.

Make yourself aware of the [**ACSQHC End-of-Life Care Audit Toolkit**](#), designed to help health service organisations to examine and improve the quality of their end-of-life care. Find the person in your organisation responsible for reporting end-of-life data/outcomes and bring it to their attention. This includes information on how to run an audit, as well as how to analyse and use the data. Other things to consider could be:

- a **Death Review or a Mortality Review Committee**^{1,2} which could see the establishment of formal procedures to consider deaths in hospital and consider opportunities to improve end-of-life care.
- an **audit**^{3,4,5} which can be addressed in many ways. Consider how your organisation assesses end-of-life care as audited against each patient's goals of care.

Types of actions may include:

- Asking what matters to the patient.⁶
 - regular review of the patient and their plan of care.
 - documented evidence of the preferred place of health as indicated by the patient.
- Providing evidence of shared decision-making.
- Clearly documenting and communicating goals.
 - documented evidence the patient had an individual goals of care plan.

EOLE insight

Asking what matters to a patient is critical, as their preferences may change, and these could be very different to clinical concerns. Consider what processes are in place within the organisation to support ongoing review of end-of-life care. Whose responsibility is it? How can they be supported?
